

- My name is _____ and I represent Colorado Healthcare Providers for Freedom which is a group of healthcare providers. An organization comprising doctors, nurse practitioners, PAs, nurses, pharmacists who stand for healthcare freedom for patients and providers
- If you would like to reach out to us I recommend reaching out to americansunifiedforfreedom@gmail.com
(Try to get this in so that people have a way to connect with us)

General Concepts to consider addressing:

- there is not medical consensus among the scientific community, only censorship
- Mandating a vaccine is discriminatory, Vaccine card checking is discriminatory
- Tearing apart the vaccinated and unvaccinated separating them is not medically or scientifically supported- manipulation
- Vaccine mandating is a one size fits all, when have we ever used that approach in medicine? It is crucial for pharmaceutical institutions to target medications to the appropriate populations to reduce side effects
- What happened to our Hippocratic oath of DO NO HARM
- There is federal blocking of mandates, so why would we mandate on a local level?

Research: (consider saying there are many studies that support this idea, but here is a specific example)

Vaccines do not prevent spread:

- Recent data from Lancet published November 1, 2021 indicates that the epidemiological relevance of COVID-19 vaccinated individuals is increasing and peak viral load did not differ by vaccination status—meaning there is clear evidence increasing that the fully vaccinated are a source of transmission
- European Journal of Epidemiology (Aug 2021)- evaluating 68 countries and 2947 US counties, there appears to be NO discernible relationship between percentage of population fully vaccinated and Covid cases. In fact, the trend line suggests a marginally positive association such that those countries with high fully vaccination populations have higher COVID cases.
- The US Centers for Disease Control and Prevention identified 4 of the top 5 countries with the highest percentage of fully vaccinated population (84-99%) as “high” transmission counties
- A study published in the Lancet in October 2021 found that the vaccine effect on reducing transmission was minimal and that minimal protection dwindles alarmingly at 3 months
- In March of 2021 the CDC abruptly stopped tracking COVID-19 in vaccinated people (“breakthrough cases”) unless they were hospitalized or died (Dr. Leana Wen, a professor at George Washington University of health policy said, “I have yet to hear a coherent explanation of why they stopped tracking this information”)

- Anna Durbin, MD director of Center for Immunization Research at John Hopkins Bloomberg School of Public Health said, “Vaccines are designed to prevent serious illness, not prevent infection or prevent any symptoms”
(then why are we mandating the COVID-19 vaccine for healthy adults and children at a low risk from serious illness)

Low risk for young and healthy:

- A Swedish study published in the New England Journal of Med that showed almost 2 million healthy children showed zero deaths from COVID-19.
- Attorney Dan Caplis who has a radio show here in Colorado sued Governor Polis for that stats on children death 0-17 and in September of 2021 it showed ZERO healthy children have died of COVID-19
- Study done by Stanford published in Environmental Research showed people <65 years of age have a very small risk of COVID-19 death without underlying predisposed health issues

Natural Immunity:

- The Brownstone Institute, composed of Harvard/Stanford/Yale and more epidemiologists and public health scientists have published a comprehensive library list of the 141 highest – quality, complete, most robust scientific studies and evidence on the superiority of natural immunity compared COVID-19 vaccine induced immunity.
 - o It showed a 27 fold increase risk of symptomatic breakthrough infection in the double vaccinated relative to the naturally immune recovered person
 - o Risk of hospital was 8 times higher in double vaccinated compared to naturally immune
- Immunologist agree that T cells, not antibodies, are the most important when testing how robust ones immune system is against COVID-19
- With similar viruses, such as SARS, studies show people attain lifelong immunity by looking at T cell antibodies, many emerging studies on Covid support this as well.

Alternative Treatments:

- There are effective treatments available for COVID-19.
 - o Uttar Pradesh, India, a population of 220 million people had a surge of Delta variant in April of 2021 that was overwhelming their hospitals so they implemented Ivermectin kits to all residents and their numbers plummeted to <1% by July 2021. Recent data showed 134 cases currently.
 - o Japan’s COVID-19 numbers also plummeted after implementation of Ivermectin
 - o Study done in Brazil in December 2021 of 220,517 showed people diagnosed COVID-19 that took Ivermectin had 2.43% risk of hospitalization and 1.4% rate of death as opposed to individuals that did not take ivermectin it showed 4.18% risk of hospitalization and 2.5% risk of death (simplify and say, half the hospitalization and death with Ivermectin)

- Ivermectin is one of the safest medicines on record, 30 times safer than aspirin. In fact the WHO hailed it as one of the “essential medicines” after treating millions in Africa, and many other countries, with minimal side effects
- o For 40 years it has been applauded universal for its safety record
- o 64 trials with 30 randomized controlled trials in 20 plus countries showing Ivermectin is effective to prevent and treat COVID-19

Vaccine Safety:

“safe” is a relative term and not scientific. Medical decisions are always a risk vs benefit ratio.

•VAERS reporting from people who have taken the COVID-19 vaccine- 19,532 have died, 99,943 hospitalized, 8,000 anaphylaxis, 11,636 Bell's Palsy, 31,652 permanently disabled, 15,425 myocarditis/pericarditis, 34,000 severe allergy reaction, 9,746 myocardial infarction, 21,900 life-threatening consequences, 4,600 low platelets, which they predict that the VAERS system is significantly underreported and months behind

o Many believe those numbers to be higher as evidenced by the Medicare Tracking System showed 48,465 people have died within 14 days of receiving the vaccine
